

METHODOLOGICAL NOTES

Electricity generated from renewable sources - share of gross electricity consumption

Indicator is calculated as a ratio between electricity produced from renewable sources and gross national electricity consumption for a given calendar year according to the requirements of the Directive 2009/28/EC on the promotion of the use of energy from renewable sources (amended by the Directive (EC) 2015/1513). It measures the contribution of electricity produced from renewable sources to the national electricity consumption.

Electricity produced from renewable sources includes electricity generation from hydro plants excluding pumping (normalized), wind (normalized), solar, geothermal and electricity from biomass/wastes. Gross national electricity consumption is calculated as: total gross national electricity generation from all fuels (including autoproduction), plus electricity imports, minus electricity exports.
